

What is it?

The Red Snake heating system is based on an extremely thin heating film (0.4 mm) made from laminated carbon fibre. Such structure ensures over 50 years of life, no maintenance, and nearly 100% efficiency. With the Red Snake system and your own solar power station you can heat your house essentially for free.

The Red Snake heating system heats rooms with infrared.

We know this pleasant warmth from sunbathing or evenings spent in front of the fireplace. The Red Snake system ensures heat comfort at an air temperature by 2-3 degrees lower than the system based on convection heaters.

Why Red Snake?

The development of building technologies in the recent years has significantly reduced the energy demand of modern houses. Building an energy-efficient house that uses 60 kWk/m² per year it is possible to reduce the cost of heating regardless of the applied technology.

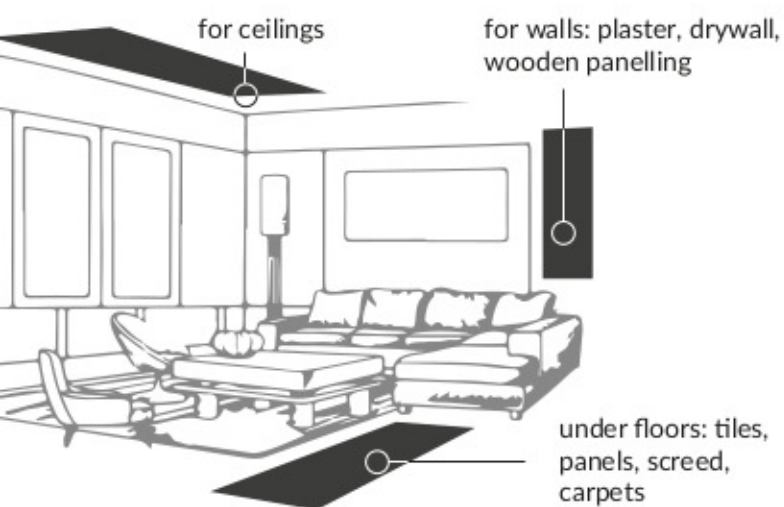

Regardless of whether you are only planning to heat a small bathroom or provide heat for the whole house – heating films are the best solution.

How to use it?

The Red Snake heating films can be installed in the floors, walls or ceilings, and efficiency of the system always remains the same. The infrared is evenly distributed in all directions, unlike warm air in convection systems.
